        running = false;
        break;

    default:
        Console.WriteLine("Invalid choice. Try again.");
        break;
}

Console.WriteLine("\nGoodbye!");
}
}
}

```

The percentage calculation was surrounded by a try-catch block. The program made sure there were no entries in total before splitting. A `DivideByZeroException` was manually thrown if it was zero. After handling the exception, the catch block prevented the program from crashing and instead showed a message.
